

Overtune 3.2.2 (ot3) — System Installation Guide

NATIVE DEPLOYMENT, IN-APP AUTO-UPDATER, AND PORTABLE SHAREWARE BUNDLES

1. System Overview & Hardware Requirements

Overtune 3 (ot3) is a high-precision digital filter design and live audio simulation workstation built on pure C++20 and Qt 6. It features automated Stage 2 compliance mathematical audits, sub-millidecibel magnitude precision, and SIMD-accelerated cascaded biquad evaluation.

- **Linux Requirements:** Any modern 64-bit Linux distribution (Ubuntu 22.04+, Fedora 38+, Arch Linux, Debian 12+) with GLIBC 2.34+ and Qt 6.4+ libraries.
- **Windows Requirements:** Windows 10 (64-bit, 1809+) or Windows 11 (x64) with Microsoft Visual C++ 2022 Redistributable.
- **Display:** Minimum recommended display resolution of 1280 × 800 with HiDPI display scaling support.

2. Linux Installation & Execution

Overtune 3 provides three straightforward deployment methods on Linux platforms:

Method A: Native Automated Setup (install_linux.sh)

The interactive installer integrates ot3 into your desktop environment, creates desktop and application menu entries, registers icons, and links the CLI binary:

```
# User-level installation (No root required - installs to ~/.local/share/
overtune3)
./scripts/install_linux.sh

# System-wide installation (Installs to /opt/overtune3 and /usr/local/bin)
sudo ./scripts/install_linux.sh
```

Once completed, launch Overtune 3 from your application menu or directly run ot3 from any terminal.

Method B: Standalone Portable Shareware Bundle

For zero-install portable deployment (e.g., from a USB drive or local directory):

```
tar -xzf overtune3-linux-x86_64.tar.gz
cd overtune3-linux-x86_64
./ot3.sh
```

Method C: Building from Source

```
./build.sh          # Builds optimized release binary in ./build/bin  
    /ot3  
./build/bin/ot3     # Direct launch
```

3. Windows Installation & Execution

Overtune 3 provides comprehensive native Windows deployment options designed for both standard desktop users and power users:

Method A: One-Click Executable Installer (`ot3-installer.exe`)

The most convenient native deployment option:

1. Double-click `ot3-installer.exe` directly from the distribution package.
2. The installer GUI opens automatically, allowing custom selection of target installation directory, Desktop shortcut creation, and Start Menu registration.
3. Click **Install Overtune 3** to finalize deployment in seconds.

Method B: Standalone Portable Shareware Package (Zero Install)

For instant, portable execution without administrative rights or registry modifications:

1. Extract `shareware\windows\overtune3-windows-x64.zip` (or copy the `overtune3-windows-x64` directory).
2. Double-click `ot3.bat` or `run.bat` to launch the application immediately.
3. Alternatively, navigate to `bin\` and execute `ot3.exe` directly.

Method C: Automated Native PowerShell Installer (`install_windows.ps1`)

To integrate Overtune 3 into Windows via command line or automated IT scripts:

```
# Standard user or Administrator execution:
powershell -ExecutionPolicy Bypass -File .\shareware\windows\install_windows.ps1
```

Supported Options & Switches:

- `-InstallDir <path>`: Target folder (defaults to `%LOCALAPPDATA%\Programs\Overtune3`).
- `-NoDesktop`: Skip creating the Desktop shortcut.
- `-NoStartMenu`: Skip creating the Start Menu shortcut.

What the installer accomplishes:

- Copies the complete application bundle including all required Qt 6.7 runtime libraries, QML engines, multimedia backends, and assets.
- Creates the **Desktop** shortcut (`Overtune 3.lnk`) and **Start Menu** entry (`Programs\Overtune 3`).
- Registers **Overtune 3 Studio** in Windows Settings → *Installed Apps* with an uninstallation hook.
- Prepares `overtune_update.bat` for atomic background updating.

Method D: Building from Source on Windows (build.bat)

If building from repository sources using Visual Studio 2022 and Qt 6:

```
# One-click configure, compile, and runtime deployment:
.\build.bat

# Direct launch:
.\run.bat
```

Windows Uninstallation

To remove Overtune 3 cleanly from the system:

- **In-App Uninstallation (Recommended):** Open Overtune 3 → click **Settings** (gear icon in sidebar) → scroll to **System Integration & Uninstall** → click **Uninstall Overtune 3**. The application cleanly deletes shortcuts, unregisters from Windows registry, schedules self-directory removal, and exits gracefully.
- **Windows Settings:** Open **Windows Settings** → **Apps** → **Installed Apps** → **Overtune 3 Studio** → **Uninstall**.
- **PowerShell Script:** Run `powershell -ExecutionPolicy Bypass -File "%LOCALAPPDATA%\Programs\Overtune 3 Studio\uninstall.ps1"`
- **Batch Script:** Double-click `"%LOCALAPPDATA%\Programs\Overtune3\uninstall.bat"`

4. In-App Auto-Updater & In-Place Atomic Updates

Overtune 3 features a unified OLED modal updater window matching the What's New and Stage 2 Verifier interfaces. It handles live patch updates seamlessly:

- **Accessing Updates:** Select **Help** → **Check for Updates...** or click the **Installer / Update Ready** badge in the titlebar.
- **Linux Atomic Patching:** Leverages POSIX atomic `unlink/rename` semantics. The running application binary is replaced smoothly in place without requiring process termination before write.
- **Windows Detached Updater:** Bypasses Windows executable file-locking by spawning a detached helper script (`overtune_update.bat`) that waits for the parent process PID to exit cleanly, replaces `ot3.exe` with `ot3.exe.new`, and restarts the updated studio application.
- **Cryptographic SHA-256 Audit:** All downloaded payload chunks are validated against release cryptographic checksums before application.

5. Command-Line Options & Essential Shortcuts
